Homework

The first part of the course is now concluded: you learned how to collect data. We now prepare for the second part: managing data in a data project. To do this we want you to keep up and put your own data in a useful structure.

Following the course we will do 5 Exercises over the course of next week

1) Decide upon a data Data-Structure for your project

2) Build a research directory and put it on GitHub.

3) Put your example data in a relational database

4) Put your database online and prepare a Research Plan

5) Present and Report your Research Plan. You will receive comments and ideas from us, and the other students. Please prepare a 10 minute presentation.

To do this, we need you to have data. Accordingly we have a little homework over the weekednd: Until <u>Monday</u>, we want you to create a first dataset that either relates to your research abstract or, if you don't know yet, choose a conference that is interesting to your subfield and has not been scraped in the course yet.
